

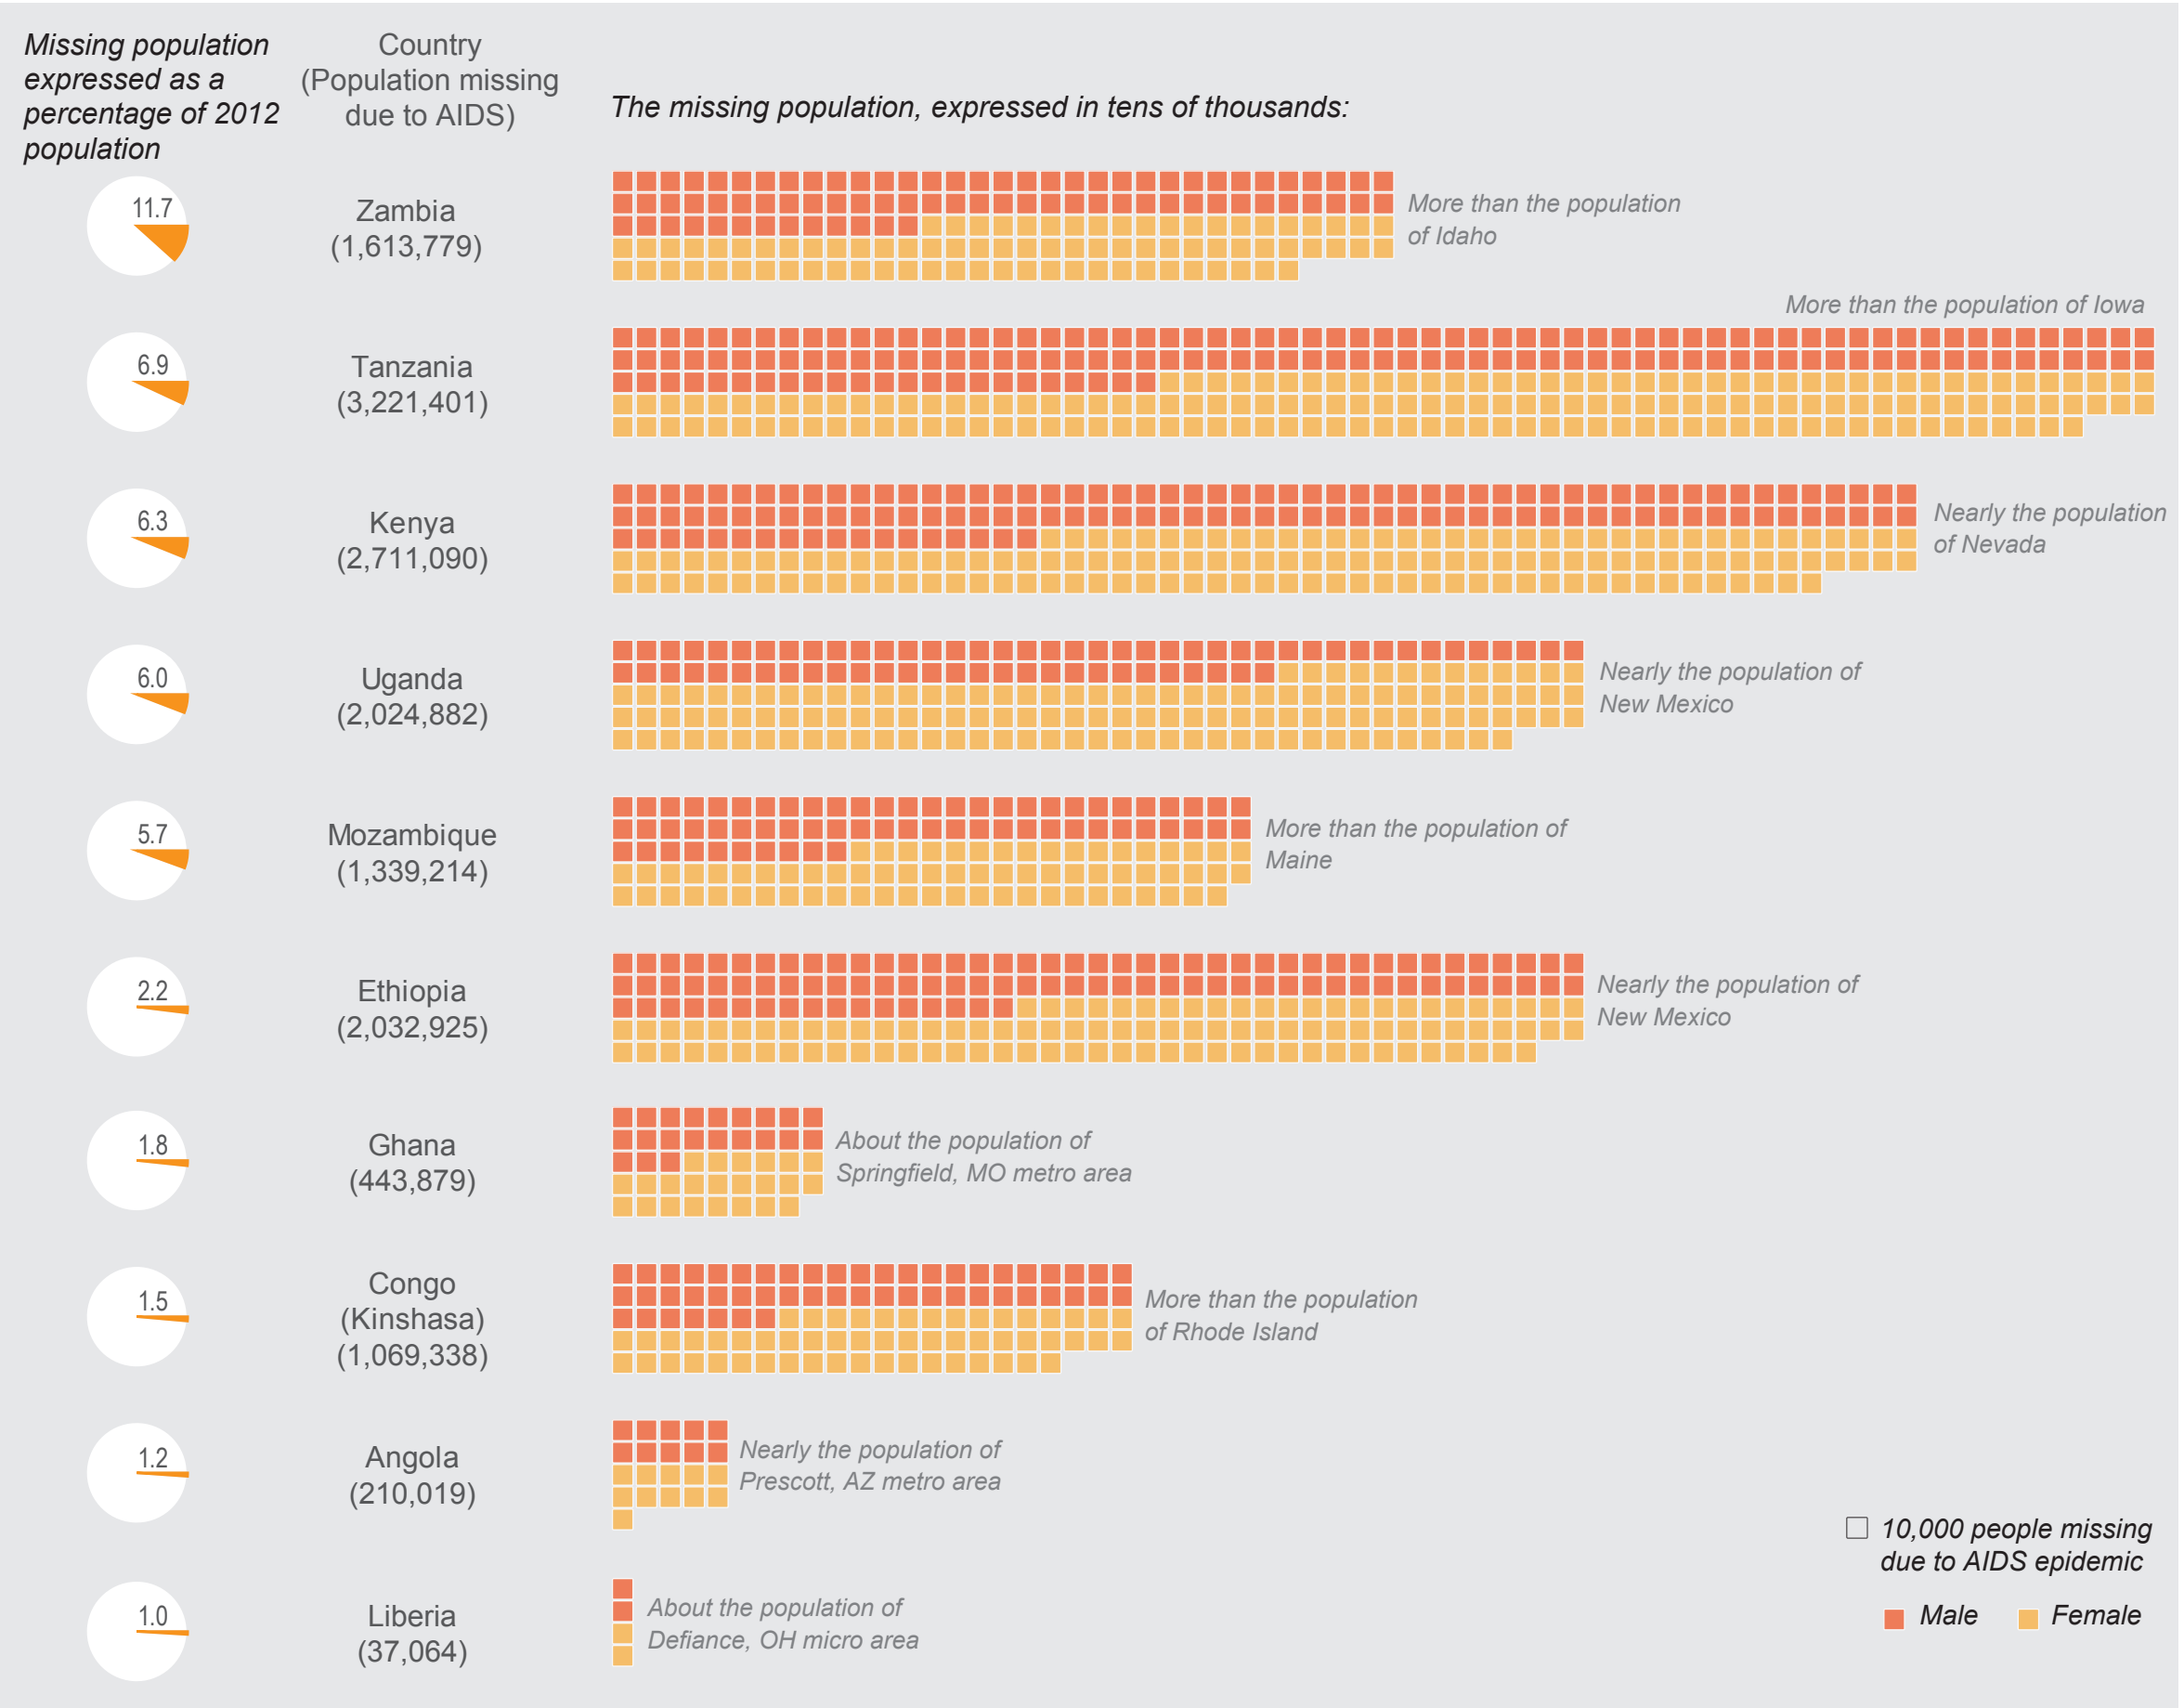

Figure 2. Population Missing Due to HIV/AIDS Epidemics, by Sex: 2012
Selected Countries in Sub-Saharan Africa

Differences in mortality patterns by age and sex result in some populations more heavily impacted than others. Females represent more than half of the missing population in the selected countries, and 65 percent in Uganda.

NOTE: This graph is derived from a comparison of the 2012 population estimate for a country to a “Without-AIDS” scenario that reflects a hypothetical population that would have resulted if the country had never been affected by an AIDS epidemic. The "missing population" is the difference between these two estimates. The U.S. state; Defiance, OH micropolitan statistical area; and Prescott, AZ and Springfield, MO metropolitan statistical area population estimates are for 2012.
